

IN THE ABSTRACT

Below please find the Abstract as replaced in Response to Office Action mailed June 29, 2005, here placed on a separate piece of paper as requested by the Examiner.

**ABSTRACT:**

A transceiver for a serial data bus is provided which transceiver includes error management. In a first example embodiment of a transceiver, error management is provided which supplies an error signal when the data bus lines are active and the receiving line simultaneously is inactive. In a second example embodiment of a transceiver, error management is provided which triggers an error signal when the transmission line is active for a longer period than a predetermined time interval, which error signal is cancelled when both the transmission line is inactive and the receiving line is active.
